Write a program to input a three digit number. Use a method int Armstrong(int n) to accept the number. The method returns 1, if the number is Armstrong, otherwise zero(0).

Sample Input: 153

Sample Output: $153 \Rightarrow 13 + 53 + 33 = 153$

It is an Armstrong Number.

```
import java.util.Scanner;
public class ArmstrongNumber {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a number: ");
        boolean isArmstrong = isArmstrongNumber(number);
        if (isArmstrong) {
            System.out.println(number + " is an Armstrong number.");
            System.out.println(number + " is not an Armstrong number.");
      @param number the number to be checked
      @return true if the number is an Armstrong number, false otherwise
    public static boolean isArmstrongNumber(int number) {
        int originalNumber = number; // Stores the original number entered by the user
        int numDigits = String.valueOf(number).length(); // Stores the number of digits in the number
        while (number > ∅) {
            int digit = number % 10; // Extracts the last digit of the number
            sum += Math.pow(digit, numDigits); // Adds the cube of the digit to the sum
number /= 10; // Removes the last digit from the number
        return sum == originalNumber; // Returns true if the sum is equal to the original number
```

```
* | `numDigits` | Stores the number of digits in the number |
* | `digit` | Stores the last digit extracted from the `number` |
*/
```

```
Enter a number: 371
371 is an Armstrong number.
```

Write a program in Java to create a 4X4 matrix and store the different numbers using input statements. Arrange the numbers of each row in ascending order and display the results.

```
import java.util.Arrays;
import java.util.Scanner;
public class MatrixSorter {
    public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
        int[][] matrix = new int[4][4];
        System.out.println("Enter the matrix values:");
        for (int i = 0; i < matrix.length; i++) {</pre>
            for (int j = 0; j < matrix[i].length; j++) {</pre>
                matrix[i][j] = scanner.nextInt();
        System.out.println("Original matrix:");
        printMatrix(matrix);
        sortMatrix(matrix);
        System.out.println("\nSorted matrix:");
        printMatrix(matrix);
    public static void sortMatrix(int[][] matrix) {
        for (int i = 0; i < matrix.length; i++) {</pre>
    public static void printMatrix(int[][] matrix) {
        for (int i = 0; i < matrix.length; i++) {</pre>
            for (int j = 0; j < matrix[i].length; <math>j++) {
                System.out.print(matrix[i][j] + " ");
            System.out.println();
```

```
* | Variable | Description

* |------|

* | `scanner` | Used to read input from the user

* | `matrix` | Stores the matrix entered by the user

* | `i` | Loop variable for rows in the matrix |

* | `j` | Loop variable for columns in the matrix |

* | */
```

```
Enter the matrix values:

14 51 71 124

151 351 12 5

51 623 1 415

14 621 63 1

Original matrix:

14 51 71 124

151 351 12 5

51 623 1 415

14 621 63 1

Sorted matrix:

14 51 71 124

5 12 151 351

1 51 415 623

1 14 63 621
```

Write a program in Java to accept Binary Number (Base 2) and convert it to its Decimal Number (Base 10).

- Source Code

```
import java.util.Scanner;
public class BinaryToDecimal {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter a binary number: ");
       String binaryStr = scanner.nextLine();
       for (int i = binaryStr.length() - 1; i >= 0; i--) {
            char digit = binaryStr.charAt(i);
               decimal += Math.pow(2, power);
           power++;
       System.out.println("Decimal equivalent: " + decimal);
       scanner.close();
```

```
Enter a binary number: 100
Decimal equivalent: 4
```

A number is said to Bouncy number if the digits of the number are unsorted.

For example,

22344 - It is not a Bouncy number because the digits are sorted in ascending order.

774410 - It is not a Bouncy number because the digits are sorted in descending order.

155349 - It is a Bouncy number because the digits are unsorted.

A number below 100 can never be a Bouncy number.

Write a program in java to accept a number. Check and display whether it is a Bouncy number or not.

```
import java.util.Scanner;
public class BouncyNumber {
   public static void main(String[] args) {
       System.out.print("Enter a number: ");
       boolean isBouncy = isBouncyNumber(number);
       if (isBouncy) {
           System.out.println(number + " is not a Bouncy number.");
       scanner.close();
       boolean increasing = false;
       boolean decreasing = false;
       int lastDigit = number % 10;
           int currentDigit = number % 10;
           if (currentDigit > lastDigit) {
               increasing = true;
            } else if (currentDigit < lastDigit) {</pre>
               decreasing = true;
            if (increasing && decreasing) {
           lastDigit = currentDigit;
```

```
return false;
}

/**

* Variable Table:

* | Variable | Description | |

* | 'scanner` | Used to read input from the user | |

* | `number` | Stores the number entered by the user | |

* | `isBouncy` | Stores the result of the check for Bouncy number |

* | `increasing` | Indicates if the digits are increasing | |

* | `decreasing` | Indicates if the digits are decreasing | |

* | `currentDigit` | Stores the current digit being compared | |

*/
```

Output

```
Enter a number: 516
516 is a Bouncy number.
```

Write a program in Java to perform the Bubble Sort Algorithm Technique in Array.

- Source Code

```
2
3
5
9
```

A Circular Prime is a prime number that remains prime under cyclic shifts of its digits. When the leftmost digit is removed and replaced at the end of the remaining string of digits, the generated number is still prime. The process is repeated until the original number is reached again.

A number is said to be prime if it has only two factors 1 and itself.

```
import java.util.Scanner;
public class CircularPrime {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a number: ");
        int number = scanner.nextInt();
        if (isCircularPrime(number)) {
           System.out.println(number + " is a circular prime.");
            System.out.println(number + " is not a circular prime.");
        scanner.close();
       String numStr = Integer.toString(number);
        for (int i = 0; i < numStr.length() - 1; i++) {</pre>
           numStr = numStr.substring(1) + numStr.charAt(0);
           if (!isPrime(Integer.parseInt(numStr))) {
    public static boolean isPrime(int number) {
        for (int i = 2; i <= Math.sqrt(number); i++) {</pre>
```

```
Enter a number: 341
341 is not a circular prime.
```

Write a program in Java to calculate the addition of two Complex number using passing and returning object concept. Design a class Complex with the following details: Data Members:

x : stores the real part

y: stores the imaginary part

Member Functions:

Complex (...): Parameterized constructor to assign value to data members.

void display (): To display the Complex Number.

Complex add (Complex obj): calculates and returns the sum of the two complex numbers.

```
import java.util.Scanner;
class ComplexNumbers {
   ComplexNumbers() \{x = 0; y = 0;\}
   ComplexNumbers(int xx, int yy) {x = xx; y = yy;}
   ComplexNumbers add(ComplexNumbers obj) {
       ComplexNumbers result = new ComplexNumbers();
   void display() {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter the real and imaginary part: ");
       int y1 = scanner.nextInt();
       System.out.print("Enter the real and imaginary part: ");
       ComplexNumbers c1 = new ComplexNumbers(x1, y1);
       ComplexNumbers c2 = new ComplexNumbers(x2, y2);
       ComplexNumbers c3 = new ComplexNumbers();
       System.out.println("First Complex Number:");
       c1.display();
       System.out.println("Second Complex Number:");
       c2.display();
       System.out.println("Final Complex Number:");
        c3.display();
```

```
Enter the real and imaginary part: 3 9
Enter the real and imaginary part: 1 0
First Complex Number:
3 + i9
Second Complex Number:
1 + i0
Final Complex Number:
4 + i9
```

Write a program in Java which will give number of days in a month depending of the month entered by the user.

```
import java.util.Scanner;
public class DayMonth {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
       int days = 0;
       String monthName = "Unknown";
       System.out.print("Input a month number: ");
       int monthNumber = scanner.nextInt();
       System.out.print("Input a year: ");
       int year = scanner.nextInt();
               monthName = "January";
               if ((year % 400 == 0) || ((year % 4 == 0) && (year % 100 != 0))) {
               break;
               monthName = "May";
               break;
               monthName = "July";
            case 8:
               monthName = "September";
```

```
Input a month number: 2
Input a year: 2016
February 2016 has 29 days
```

Write a program in Java to store 10 different numbers in a single dimensional array. Display the numbers after eliminating the duplicate numbers from the array

- Source Code

```
import java.util.Arrays;
public class duplicateDeleter {
   public static void main(String[] args) {
       int[] uniqueNumbers = eliminateDuplicates(numbers);
       System.out.println("Final set of numbers: " + Arrays.toString(uniqueNumbers));
   public static int[] eliminateDuplicates(int[] numbers) {
       int[] uniqueNumbers = new int[numbers.length];
       int index = 0;
       for (int i = 0; i < numbers.length; i++) {</pre>
           boolean isDuplicate = false;
                if (numbers[i] == numbers[j]) {
                    isDuplicate = true;
                    break;
            if (!isDuplicate) {
               uniqueNumbers[index++] = numbers[i];
       return Arrays.copyOf(uniqueNumbers, index);
```

Output

```
Final set of numbers: [1, 2, 3, 4, 5, 6, 7, 8, 10]
```

Write a Program in Java to input a number and check whether it is a Fascinating Number or not.

Fascinating Numbers: Some numbers of 3 digits or more exhibit a very interesting property. The property is such that, when the number is multiplied by 2 and 3, and both these products are concatenated with the original number, all digits from 1 to 9 are present exactly once, regardless of the number of zeroes.

```
import java.util.Scanner;
public class FascinatingNumber {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter a number: ");
       boolean isFascinating = isFascinatingNumber(number);
        if (isFascinating) {
           System.out.println(number + " is a fascinating number.");
            System.out.println(number + " is not a fascinating number.");
        scanner.close();
   public static boolean isFascinatingNumber(int number) {
       String concatenatedString = String.valueOf(number) +
                String.valueOf(number * 2) +
                String.valueOf(number * 3);
       Set<Character> digitSet = new HashSet<>();
        for (char digit : concatenatedString.toCharArray()) {
            if (digit != '0') {
               if (!digitSet.add(digit)) {
        return digitSet.size() == 9;
```

```
* | `scanner` | Used to read input from the user | */
}
```

```
Enter a number: 451
451 is not a fascinating number.
```

Write a program in Java to find the Fibonacci Numbers up until the value inputted by the user. Give a list of all fibonacci numbers nearest to the user defined value

- Source Code

```
class FibonacciSeries {
   public static void main(String[] args) {
       Scanner sc = new Scanner(System.in);
       System.out.print("Enter the number: ");
               System.out.println(b);
               break;
```

```
Enter the number: 69
1
1
2
3
5
```

A happy number is a number which eventually reaches 1 when replaced by the sum of the square of each digit.

```
import java.util.HashSet;
import java.util.Scanner;
public class HappyNumber {
   public static void main(String[] args) {
       System.out.print("Enter a number to check if it is a happy number: ");
       int number = sc.nextInt();
       Set<Integer> seen = new HashSet<>();
       boolean isHappy = false;
       while (!seen.contains(number)) {
           seen.add(number);
               sum += digit * digit;
           number = sum;
               isHappy = true;
               break;
       if (isHappy) {
           System.out.println(number + " is not a happy number.");
```

Enter a number to check if it is a happy number: 42 42 is not a happy number.

Write a program in Java to accept 10 numbers in an array and sort them ascending order using Insertion sort technique. Display the results with proper Message.

- Source Code

```
class InsertionSort {
   public static void main(String[] args) {
           while (j >= 0 && t < a[j]) { // Checking
               a[j + 1] = a[j];
            a[j + 1] = t; // Swapping
       System.out.println("After sorting:");
```

```
Enter a number: 5
Enter a number: 1
Enter a number: 3
Enter a number: 2
Enter a number: 7
Enter a number: 3
Enter a number: 4
Enter a number: 2
Enter a number: 7
```

Enter a number: 2
After sorting:
1 2 2 2 3 3 4 5 7 7

A positive whole number 'n' that has 'd' number of digits is squared and split into two pieces, a right-hand piece that has 'd' digits and a left-hand piece that has remaining 'd' or 'd-1' digits. If the sum of the two pieces is equal to the number, then 'n' is a Kaprekar number. The first few Kaprekar numbers are: 9, 45, 297

Write a program in Java to display all Kaprekar numbers from 1 to 1000 and also calculate their sum & display the result with a proper message.

```
public class KarpekarNumbers {
   static boolean kaprekar(int n) {
           return true;
        int sq_n = n * n;
        int copy = sq_n;
        int d = 0;
        while (copy != 0) {
        for (int r_digits = 1; r_digits < d; r_digits++) {</pre>
            int eq_parts = (int) Math.pow(10, r_digits);
            if (eq_parts == n)
           int sum = sq_n / eq_parts + sq_n % eq_parts;
    public static void main(String[] args) {
       Scanner sc = new Scanner(System.in);
       System.out.print("Enter the number to which you want the sum");
        int n = sc.nextInt();
       System.out.println();
        System.out.println("Sum of all Karpekar Numbers: " + s);
```

```
Enter the number to which you want the sum 1000
1 9 45 55 99 297 703 999
Sum of all Karpekar Numbers: 2208
```

Write a program in Java to input a number and reverse the digits of the number by using recursive function. Display the new number.

- Source Code

```
import java.util.Scanner;
public class NumberReverse {
   public static void main(String[] args) {
       System.out.print("Enter a number: ");
       int number = sc.nextInt();
       int reversedNumber = reverseNumber(number);
       int lastDigit = number % 10;
       int remainingDigits = number / 10;
       int reversed = reverseNumber(remainingDigits);
       int numDigits = (int) Math.log10(remainingDigits) + 1;
       return lastDigit * (int) Math.pow(10, numDigits) + reversed;
```

```
Enter a number: 5215
Reversed number: 5125
```

Palindrome Number in Java: Write a program to accept a number from the user and check whether it is a Palindrome number or not. A number is a Palindrome which when reads in reverse order is same as in the right order.

- Source Code

```
import java.util.Scanner;
public class PalindromeNumber {
   public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter a number: ");
       int number = scanner.nextInt();
       boolean isPalindrome = isPalindromeNumber(number);
       if (isPalindrome) {
           System.out.println(number + " is a palindrome number.");
       scanner.close();
       int originalNumber = number;
       int reversedNumber = 0;
       while (number > 0) {
           int digit = number % 10;
           reversedNumber = reversedNumber * 10 + digit;
       return originalNumber == reversedNumber;
```

```
Enter a number: 789987
789987 is a palindrome number.
```

Write a program in Java to print the following pattern.

A AA AAA

AAAA

AAAAA

- Source Code

```
A
AA
AAA
AAAAA
```

Write a program to accept a set of n integers (where n > 0) in a single dimensional array. Arrange the elements of the array such that the lowest number appears in the center of the array, next lower number in the right cell of the center, next lower in the left cell of the center and so on..... The process will stop when the highest number will set in its appropriate cell. Finally, display the array elements. (Pendulum Arrangement of Array)

```
import java.util.Scanner;
class PendulumSort {
   public static void main(String[] args) {
       Scanner sc = new Scanner(System.in);
       int n = sc.nextInt(); // Input the order of matrix from the user
       if (n > 1 \&\& n <= 20) {
            int a[] = new int[n]; // Initializing array
            int b[] = new int[n]; // Initializing array
                System.out.print("Enter number: ");
            System.out.println("Original array:");
                    if (a[j] < a[j + 1]) { // Checking
                        int t = a[j]; // Swapping
                        a[j] = a[j + 1]; // Swapping
                        a[j + 1] = t; // Swapping
            System.out.println();
            System.out.println("Rearranged array:");
        } else {
            System.out.println("Invalid Range");
```

```
/**
 * Variable Table:
 *
 * | Variable | Description
 * |-----|
 * | `n` | Represents the order of the matrix |
 * | `a` | Array used to store the numbers |
 * | `b` | Array used to store the rearranged numbers |
 * | `m` | Represents the middle index of the array |
 * | `L` | Represents the left index for rearranging the numbers |
 * | `r` | Represents the right index for rearranging the numbers |
 */
}
```

```
Enter the order: 5
Enter number: 1
Enter number: 61
Enter number: 613
Enter number: 21
Enter number: 5
Original array: 1 61 613 21 5
Rearranged array: 1 21 613 61 5
```

Write a program that encodes a word into Piglatin. To translate word into Piglatin word, convert the word into uppercase and then place the first vowel of the original word as the start of the new word along with the remaining alphabets. The alphabets present before the vowel being shifted towards the end followed by "AY".

- Source Code

```
import java.util.Scanner;
public class PigLatin {
   public static void main(String[] args) {
       System.out.print("Enter a string: ");
       String inputString = scanner.nextLine();
       String[] words = inputString.split("\\s+");
       for (String word : words) {
           String pigLatinWord = convertToPigLatin(word);
           System.out.print(pigLatinWord + " ");
   public static String convertToPigLatin(String word) {
       char firstChar = Character.toLowerCase(word.charAt(0));
       if (isVowel(firstChar)) {
           return word + "yay";
           return word.substring(1) + firstChar + "ay";
       ch = Character.toLowerCase(ch);
```

```
Enter a string: Hello There ellohay heretay
```

A computer salesman gets commission on the following basis:

Sales Commission Rate

Rs. 0 - 20,000 = 3%

Rs. 20,000 - 50,000 = 12%

Rs. 50,001 and more = 31%

After accepting the sales as input, calculate and print his commission amount and rate of commission.

- Source Code

```
public class SalesCommission {
   public static void main(String[] args) {
       double commission = 0.0;
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter the sales amount: ");
       sale = scanner.nextInt();
       if (sale <= 20000) {
           commission = sale * 0.3;
        if (sale >= 20000 && sale <= 50000) {
           commission = sale * 0.12;
        if (sale >= 50000) {
            commission = sale * 0.31;
       System.out.println("Commission amount: " + commission);
       System.out.println("Commission rate: " + rate + "%");
```

Output

```
Enter the sales amount: 560000
```

Commission amount: 173600.0

Commission rate: 31%

Write a program in Java to accept a string from the user. Count and display the number of upper case characters, the number of lower case characters and the number of vowels as per the user's choice (Using Switch Case)

```
import java.util.Scanner;
public class StringAnalysis {
    public static void main(String[] args) {
       Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a string: ");
        String inputString = scanner.nextLine();
        System.out.println("Choose an option:");
        System.out.println("1. Count uppercase characters");
        System.out.println("2. Count lowercase characters");
        System.out.println("3. Count vowels");
        int option = scanner.nextInt();
        switch (option) {
            case 1:
                int uppercaseCount = 0;
                for (int i = 0; i < inputString.length(); i++) {</pre>
                    if (Character.isUpperCase(inputString.charAt(i))) {
                        uppercaseCount++;
                System.out.println("Uppercase count: " + uppercaseCount);
                break;
                int lowercaseCount = 0;
                for (int i = 0; i < inputString.length(); i++) {</pre>
                    if (Character.isLowerCase(inputString.charAt(i))) {
                        lowercaseCount++;
                System.out.println("Lowercase count: " + lowercaseCount);
            case 3:
                for (int i = 0; i < inputString.length(); i++) {</pre>
                    char ch = inputString.charAt(i);
                        vowelCount++;
                System.out.println("Vowel count: " + vowelCount);
                System.out.println("Invalid option");
```

```
Enter a string: MY name is MaHaRsH
Choose an option:
1. Count uppercase characters
2. Count lowercase characters
3. Count vowels
1
Uppercase count: 6
```

Write a program by using a class in Java with the following specifications:

Class name — StringOP

Data members:

String str String rev

Member functions:

StringOP() — to initialize variable void input() — to input a the variables void process() — to reverse the string str and put it into string rev

```
import java.util.Scanner;
public class StringOP {
   private String str;
   private String rev;
   public StringOP() {
       Scanner scanner = new Scanner(System.in);
       System.out.print("Enter a sentence: ");
       str = scanner.nextLine();
       scanner.close();
       StringBuilder sb = new StringBuilder(str);
       rev = sb.reverse().toString();
   public static void main(String[] args) {
       StringOP stringOP = new StringOP();
       stringOP.input();
       stringOP.process();
       System.out.println("Original sentence: " + stringOP.str);
       System.out.println("Reversed sentence: " + stringOP.rev);
```

```
Enter a sentence: The great pyramids
Original sentence: The great pyramids
Reversed sentence: sdimaryp taerg ehT
```

Write a program in Java to enter a natural number. display all the possible combinations of consecutive natural number which adds up to give the sum equal to the original number.

- Source Code

```
public class sumNatural {
   public static void main(String[] args) {
       System.out.print("Enter a positive integer: ");
       int n = sc.nextInt();
                   System.out.print(k + " ");
                System.out.println();
```

```
Enter a positive integer: 15
1 2 3 4 5
4 5 6
7 8
```

Write a program in Java to perform all the arithmetic calculations using Switch Case

- Source Code

```
public static void main(String[] args) {
   System.out.println("Enter value of 1st number: ");
   int a = sc.nextInt();
   System.out.println("Enter value of 2nd number: ");
   System.out.println("Select operation");
   System.out.println("Addition-a: Subtraction-s: Multiplication-m: Division-d: ");
           System.out.println("Sum of the given two numbers: " + (a + b));
           System.out.println("Difference between the two numbers: " + (a - b));
           System.out.println("Product of the two numbers: " + (a * b));
           System.out.println("Result of the division: " + (a / b));
           System.out.println("Invalid input");
```

```
Enter value of 1st number:

14

Enter value of 2nd number:
6134
```

Select operation

Addition-a: Subtraction-s: Multiplication-m: Division-d:

m

Product of the two numbers: 85876

Write a program in Java (Using Scanner Class) to enter a token/words in a mixed case and display the new token after deleting all the vowels. Finally arrange the new token in alphabetical order of letters.

- Source Code

```
import java.util.Scanner;
import java.util.Arrays;
public class vowelDeleter {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a token/words in mixed case: ");
        String inputToken = scanner.nextLine();
        String newToken = deleteVowels(inputToken);
        System.out.println("New token after deleting vowels: " + newToken);
       char[] charArray = newToken.toCharArray();
        Arrays.sort(charArray);
        String sortedToken = new String(charArray);
        System.out.println("New token in alphabetical order: " + sortedToken);
    public static String deleteVowels(String token) {
        StringBuilder sb = new StringBuilder();
        for (int i = 0; i < token.length(); i++) {</pre>
            if (!isVowel(ch)) {
                sb.append(ch);
        return sb.toString();
```

```
Enter a token/words in mixed case: The wall is made out of cememt

New token after deleting vowels: Th wll s md t f cmmt

New token in alphabetical order: Tcdfhllmmmsttw
```

The End
